

# GPS TRACKING LOAD CELL SYSTEM

DigiCore Australia and Howard Instruments bring you a revolutionary solution to manage the load on your trucks without the need for weighbridges.

## How it works

Load data gathered by the Kimax load cell system is transferred to a remote compliance manager via our DCA420 GPS module.

In what can be considered a significant advance, we have integrated information received from the Kimax

load cell system with our DCA420 GPS obtained information, providing a single interface from where compliance managers will be able to not only see truck movement online, but also manage truck load bearing.

## The benefits are obvious

Rather than having use expensive weighbridges, all trucks and trailers will automatically report the load they carry back to base, as and when they are loaded and unloaded, as well at all times during movement.

Knowing the load on each truck and each trailer will not only protect trucking businesses against statutory penalties and litigation exposures, but also enable them to optimise truck utilisation.

**Please contact us on 1300 736 067 for more information and to discuss a trial for your fleet.**
